SHORT REPORT

**Perspective: How to evaluate studies
on peri-operative nutrition?
Considerations about the definition of optimal
nutrition for patients and its key role in the
comparison of the results of studies on
nutritional intervention**

H.P. Sauerwein^{a,*}, R.J.M. Strack van Schijndel^b

^aDepartment of Endocrinology and Metabolism, Academic Medical Center, F5-170, Meibergdreef 9,
1105 AZ Amsterdam, The Netherlands

^bDepartment of Intensive Care, VU University Medical Center, PO Box 7057, 1007 MB Amsterdam, The Netherlands

3 challenges of optimal nutrition

1. Definition?
2. How to achieve?
3. Effect on outcome?

1. Definition

- Sauerwein & Strack van Schijndel, 2007:
Optimal nutrition for intensive care patients:
 - energy as determined by indirect calorimetry plus 10% for activity
 - protein provision of at least 1.2 grams/kg pre-admission weight per day

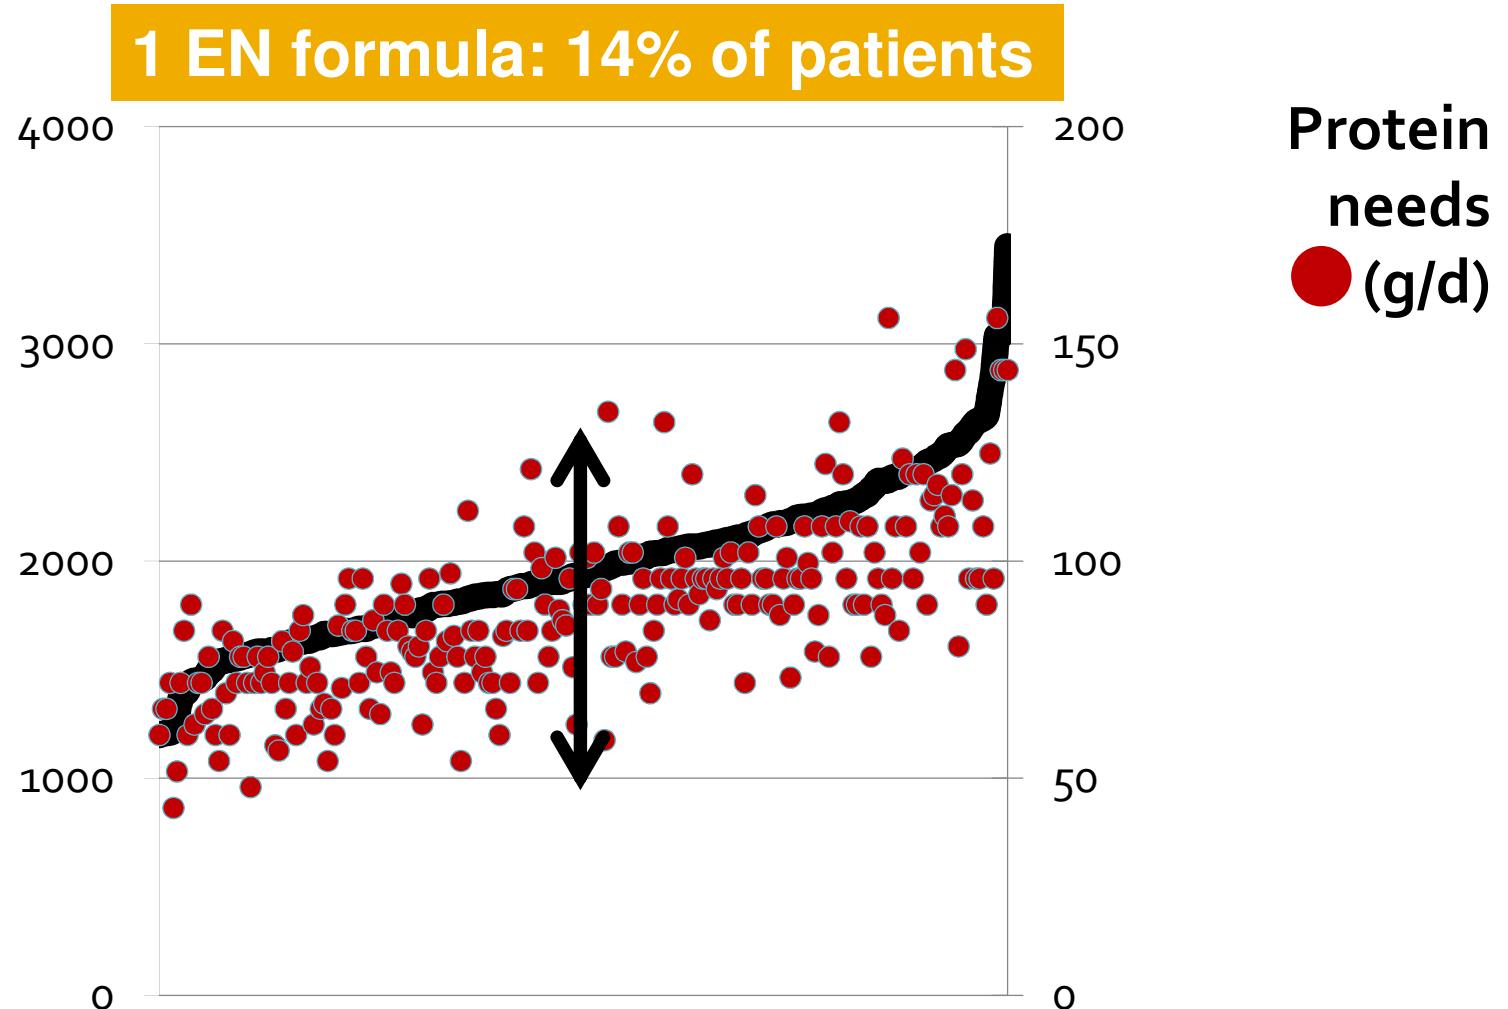

CBO richtlijn perioperatieve voeding, 2007

Sauerwein & Strack van Schijndel. Clin Nutr. 2007;26:154-8.

2. How to achieve?: algorithm

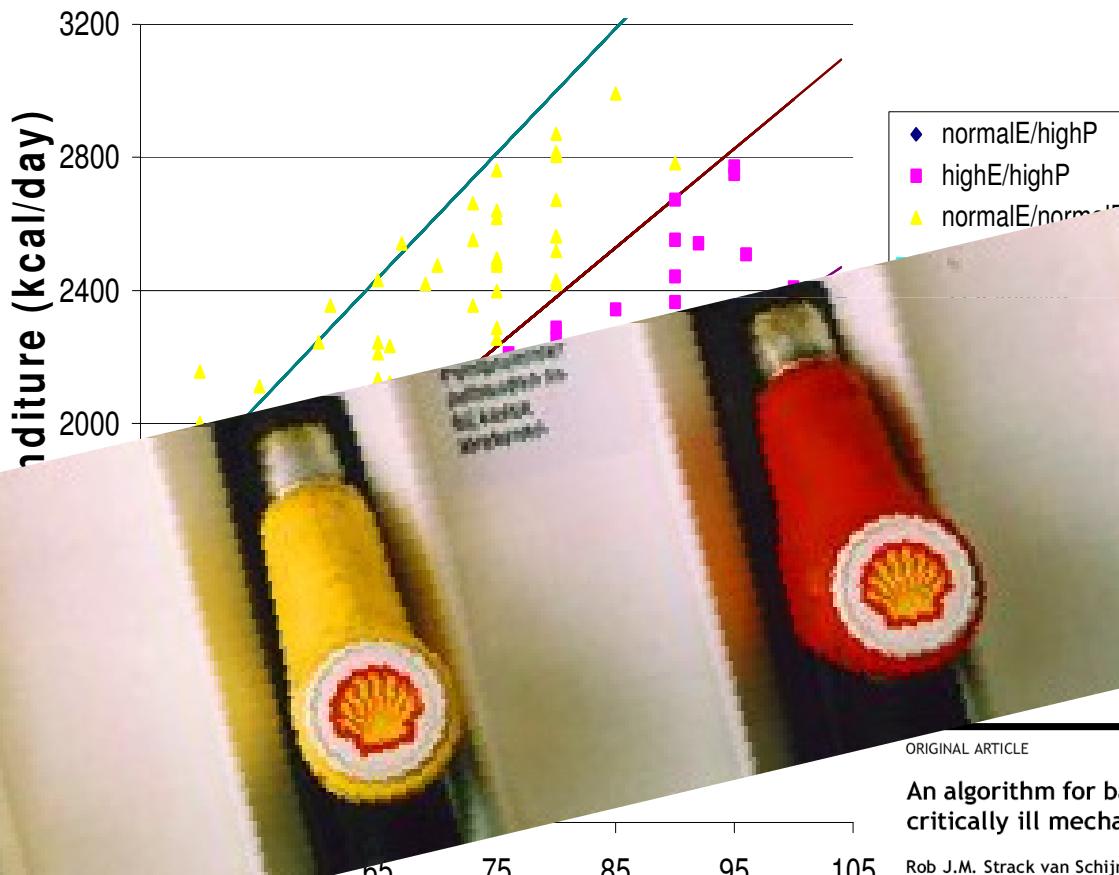

Indirect
Calorimetry
(kcal/d)

Strack van Schijndel RJM, et al. e-SPEN 2007;2:69–74;
de Groot SDW, et al. Clin Nutr Supplements 2010;5:30-31.

Strack van Schijndel et al. 2007

3 EN+algorithm: 89% of patients (in theory)

ORIGINAL ARTICLE

An algorithm for balanced protein/energy provision in critically ill mechanically ventilated patients

Computerized advice and NutriScan

Voedingsadvies

... 14-02-2007 16:57 Ververs

Advies voeding: Nutrison standaard
Advies snelheid: 113 ml/uur
Opmerking: Met deze Nutrison standaard krijgt de patiënt 109 gram eiwit/24-uur en dat is 1,4 gram Eiwit/kg/24-uur en 2717 kcal/24-uur.

NB: deze berekeningen gelden niet als patiënt parenterale voeding behoeft.
NB: deze berekeningen zijn alleen valide als lengte en gewicht correct zijn ingevoerd!

-----**VERKLARING**-----

Gewicht:	78	kg
Lengte:	193	cm
Leeftijd:	20	jaar
Geslacht	Man	
BMI:	20,9	kg/m ²
Laatste gemeten TEE	2717	kcal/24-uur
Strack-ratio:	34,8	2717 / 78

Ratio > 29.8 dan Nutrison standaard

Snelheid:
Als advies Nutrison standaard dan caloriefactor 1.0 en proteinfactor 0.040
Aantal ml/24-uur = TEE / Caloriefactor = 2717 / 1 = 2717 ml/24-uur
Aantal ml/uur = (Aantal ml/24-uur)/24 = 2717 / 24 = 113 ml/uur

hosted at
<http://online.sagepub.com>

Methods

- Prospective observational cohort study, mixed medical-surgical ICU, academic hospital
- Mechanically ventilated patients were included 3-5d after admission
- Optimal nutrition targets:
 - **Energy target:** >90% REEx_{1.1} (Deltatrac)
 - **Protein target:** >1.2 g/kg
- Cumulative balances were calculated for the period of mechanical ventilation

Statistics

- Cox regression analysis: mortality
- Independent variable:
 1. Protein and energy target achieved
 2. Energy target achieved

Both versus no target achieved
- Adjustments for gender, age, BMI, Apache II, diagnosis, and hyperglycemic index

Results: Patient characteristics

N=886; n=24 (3%) protein target achieved

	No target	Protein +energy	Energy
N (%)	412	245	205
Female, %	28%	48%	44%
Weight, kg	82	69	75
BMI, kg/m ²	27	24	25
Apache II	23	23	23

Results: Diagnosis

	No	Protein +energy	Energy
Trauma	5.4%	6.7	4.9
Sepsis	11.8	17.1	16.8
Respiratory	17.2	22.9	25.7
Surgical	23.8	26.2	23.5
Neurologic	6.9	8.6	9.3
Reanimation	13.2	2.4	5.3
Cardiovascular	17.6	10.5	11.5
Others	4.2	5.7	3.1

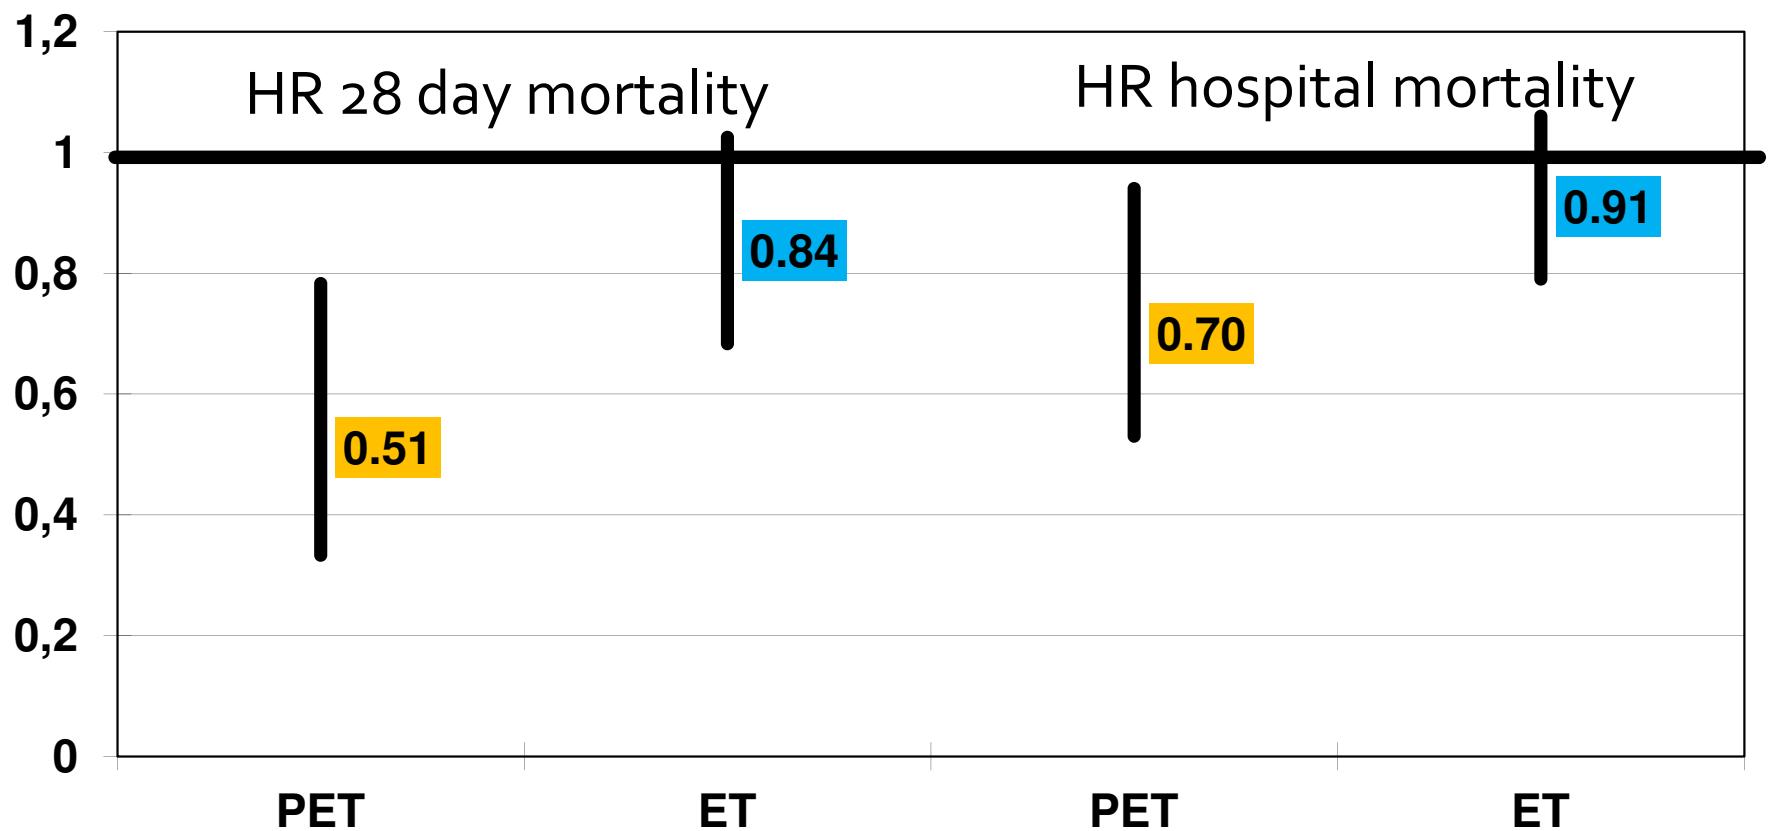

Results: Nutrition

	No	Protein +energy	Energy
Energy intake			
kcal/d	1572	1897	1819
% of target	74%	99%	96%
Protein intake			
gram/kg.d	0.83	1.31	1.06
% of target	70%	112%	89%

Results: Outcome

Length of stay (median, d)	No	Protein +energy	Energy
LOV	12	25	20
ICU LOS	15	27	22
Hosp LOS	28	46	38
28d mort. (%)	20	15	20
ICU mort. (%)	18	22	24
Hosp mort. (%)	31	39	37

Optimal nutrition and outcome

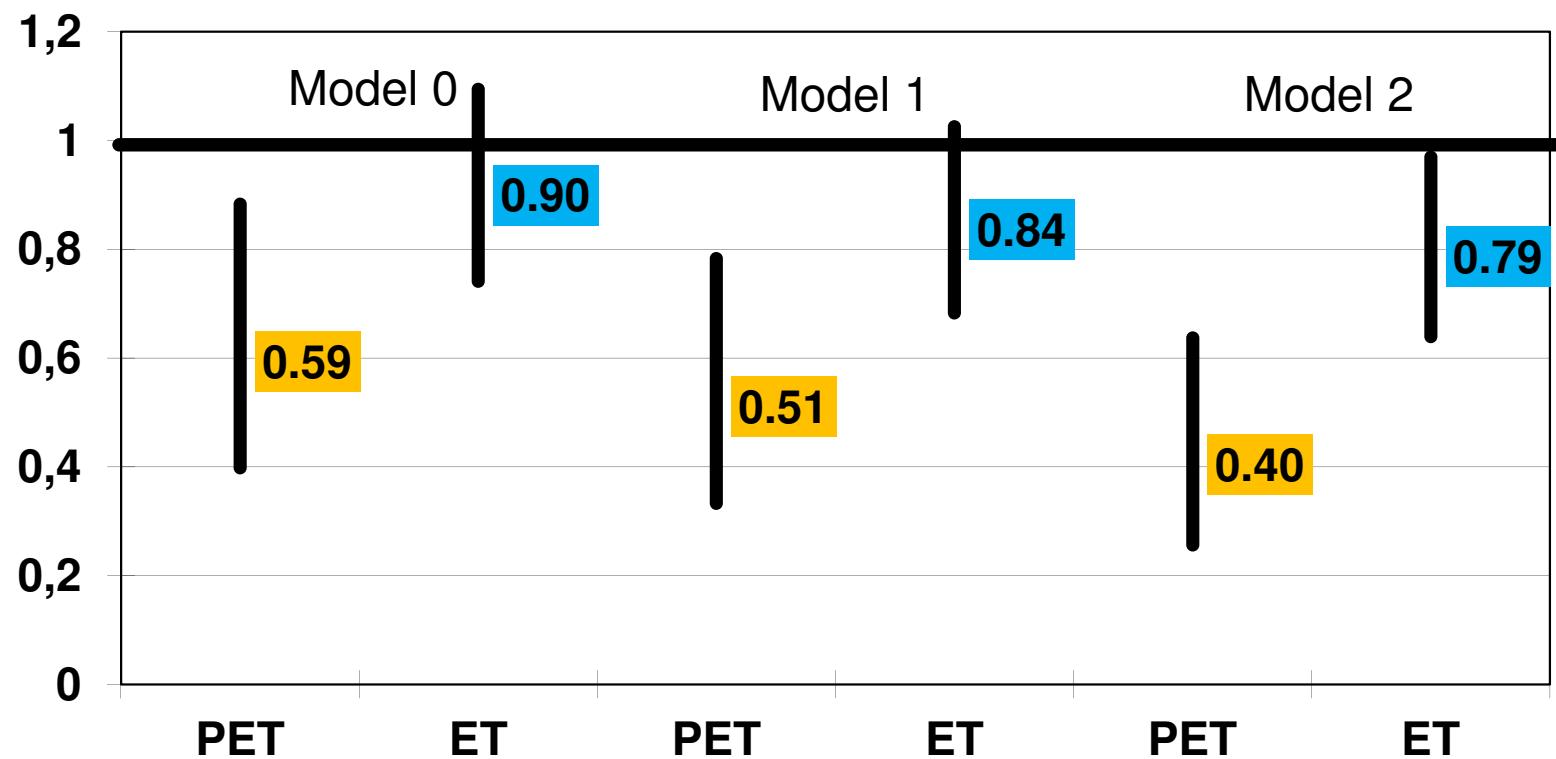

HR adjusted for sex, age, BMI, APACHE II score, diagnosis category, and hyperglycaemic index

Weijs et al. JPEN 2012

Optimal nutrition and outcome

HR 28 day mortality

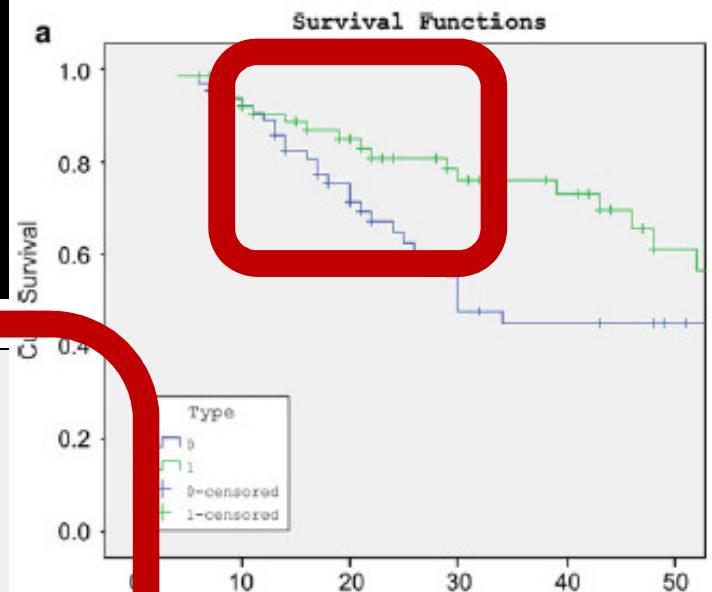

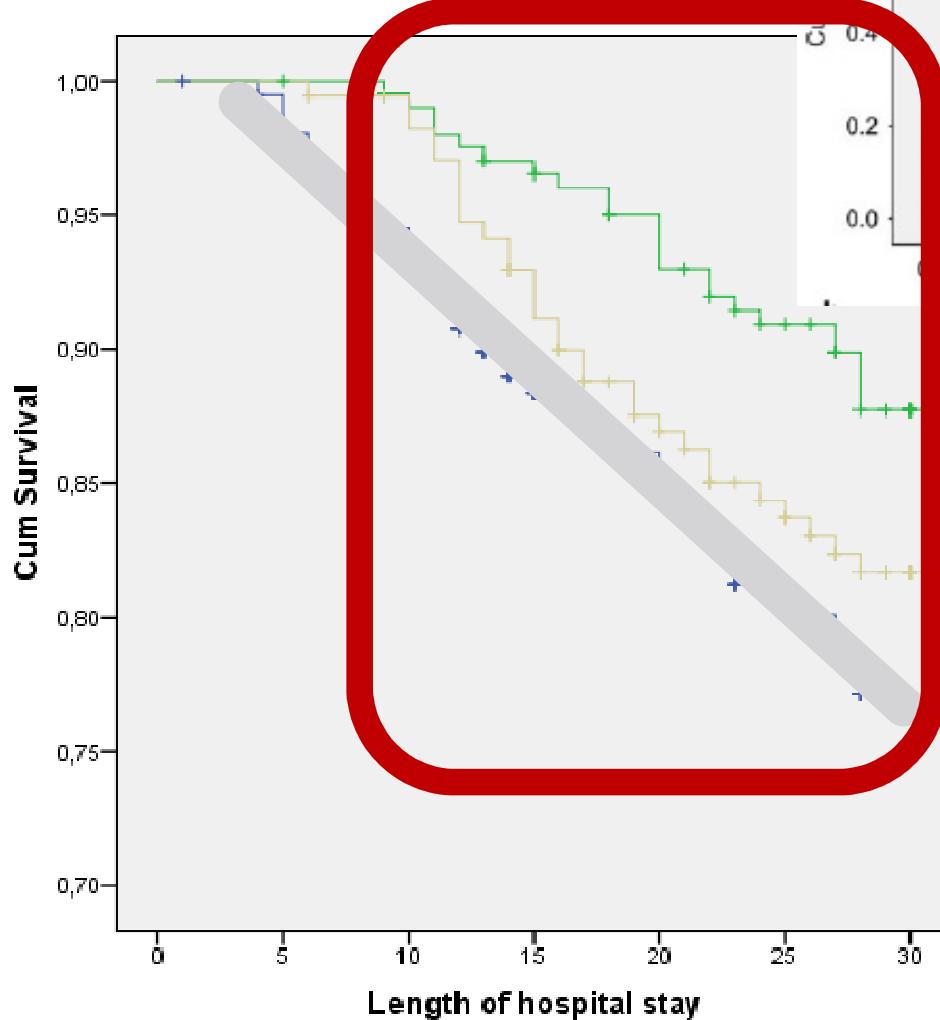

Model 0 = unadjusted;

Model 1 = HR adjusted for sex, age, BMI, APACHE II score, diagnosis category, and hyperglycaemic index (HGI);

Model 2 = adjusted for model 1 and time to reach the energy target (in days) and the amount of parenteral nutrition (in mL/day).

Survival

Protein + energy
Energy
**No target
reached**

Results: Outcome

Length of stay (median, d)	No	Protein	Protein +energy	Energy
LOV	12	20	25	20
ICU LOS	15	21	27	22
Hosp LOS	28	44	46	38
28d mort. (%)	20	13	15	20
ICU mort. (%)	18	17	22	24
Hosp mort(%)	31	21	39	37

Conclusion

- Read: Sauerwein & Strack van Schijndel!
- Critically ill patients that achieve
both the protein and energy target
have lower mortality compared to patients
that only achieve the energy target.
- Role of disease severity? => randomisation

Optimal nutrition and outcome in malnourished hospital patients

Study 2

Weijs PJ, Leistra E, Schipper M,
Oostenbrink J, Kruizenga HM.
Achieving protein and energy targets in
malnourished hospitalized patients on day 4
of admission improves length of hospital
stay.
Clin Nutr Suppl 2011;6:21(O50)
(full paper submitted for publication)

Methods

- Retrospective analysis
- Patients admitted to Franciscus Hospital in 2008 were screened for malnutrition (SNAQ)
 - SNAQ ≥ 3 (**malnourished** ~10% of admitted)
 - protein and energy intake assessment **day 4**
 - Targets:
 - ❖ Energy target: >90% **Harris-Benedict** $\times 1.3$
 - ❖ Protein target: >1.2 g/kg

Statistics

- Linear regression analysis
- Dependent variable: Ln(Length of Stay)
- Independent variable:
 - ❖ Protein and Energy target achieved (y/n)
 - ❖ Energy target achieved (y/n)
- Both versus No target achieved (y/n)**
- Adjustments for age, sex, BMI, and cancer
- Sensitivity analysis was performed for energy intake >25% and >50% of energy requirement (Dupertuis ea)

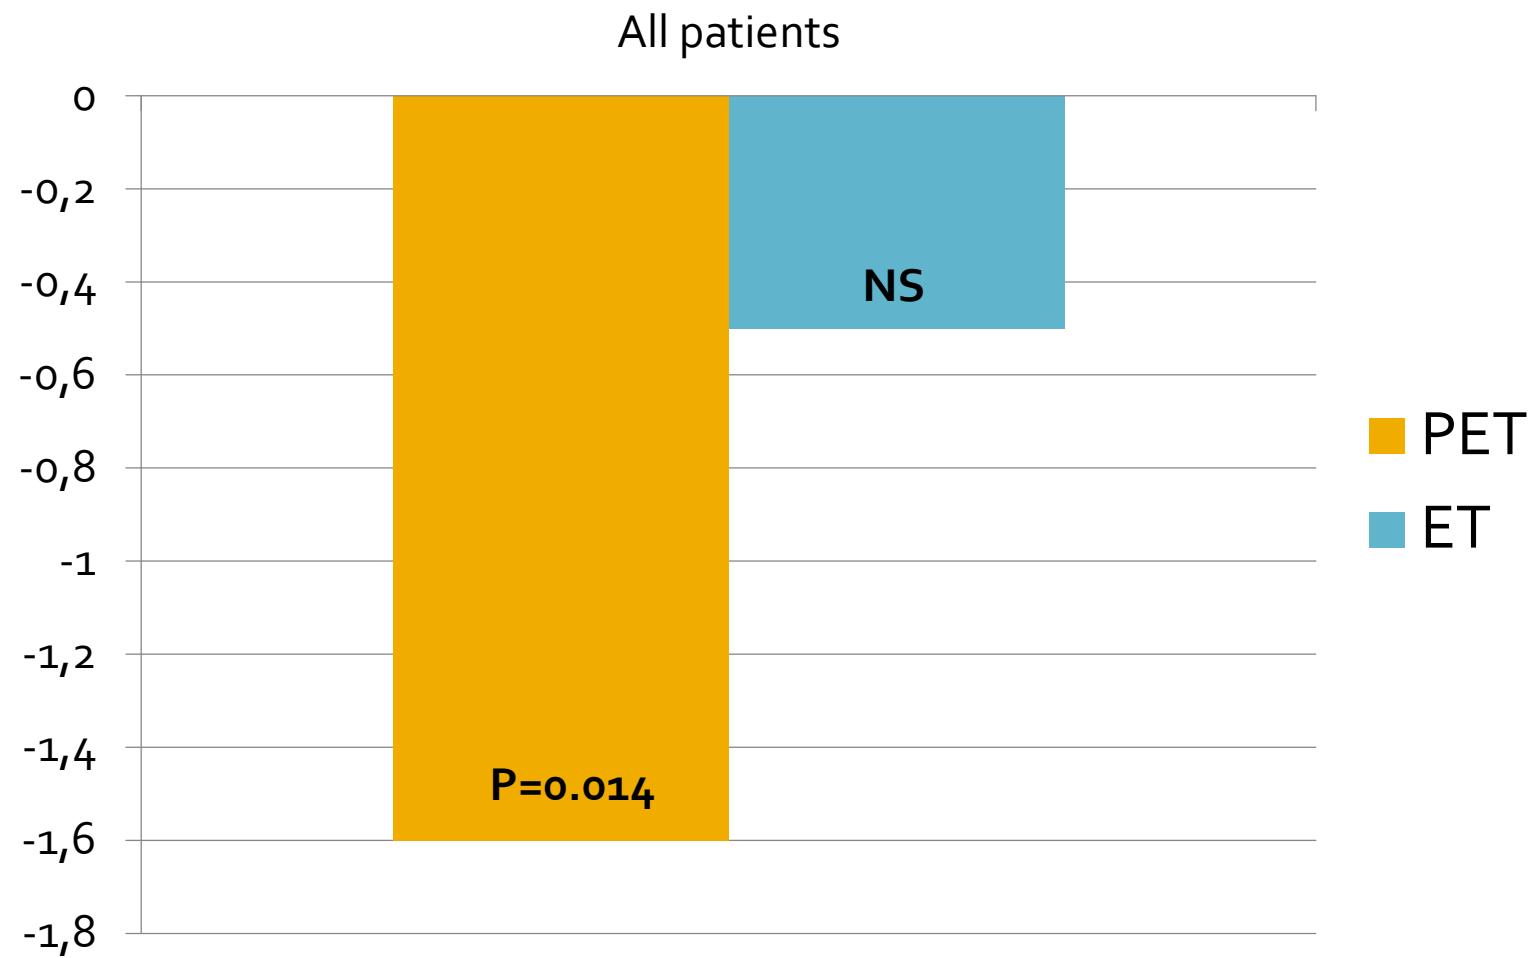

Results: Patient Characteristics

	NT	PET	ET
No. Patients	289	165	147
females, %	51	55	48
Weight, kg	71 ± 15	59 ± 12	68 ± 11
BMI, kg/m ²	25 ± 5	21 ± 4	24 ± 4
sipfeed, %	27	36	26
tubefeed, %	4	9	3

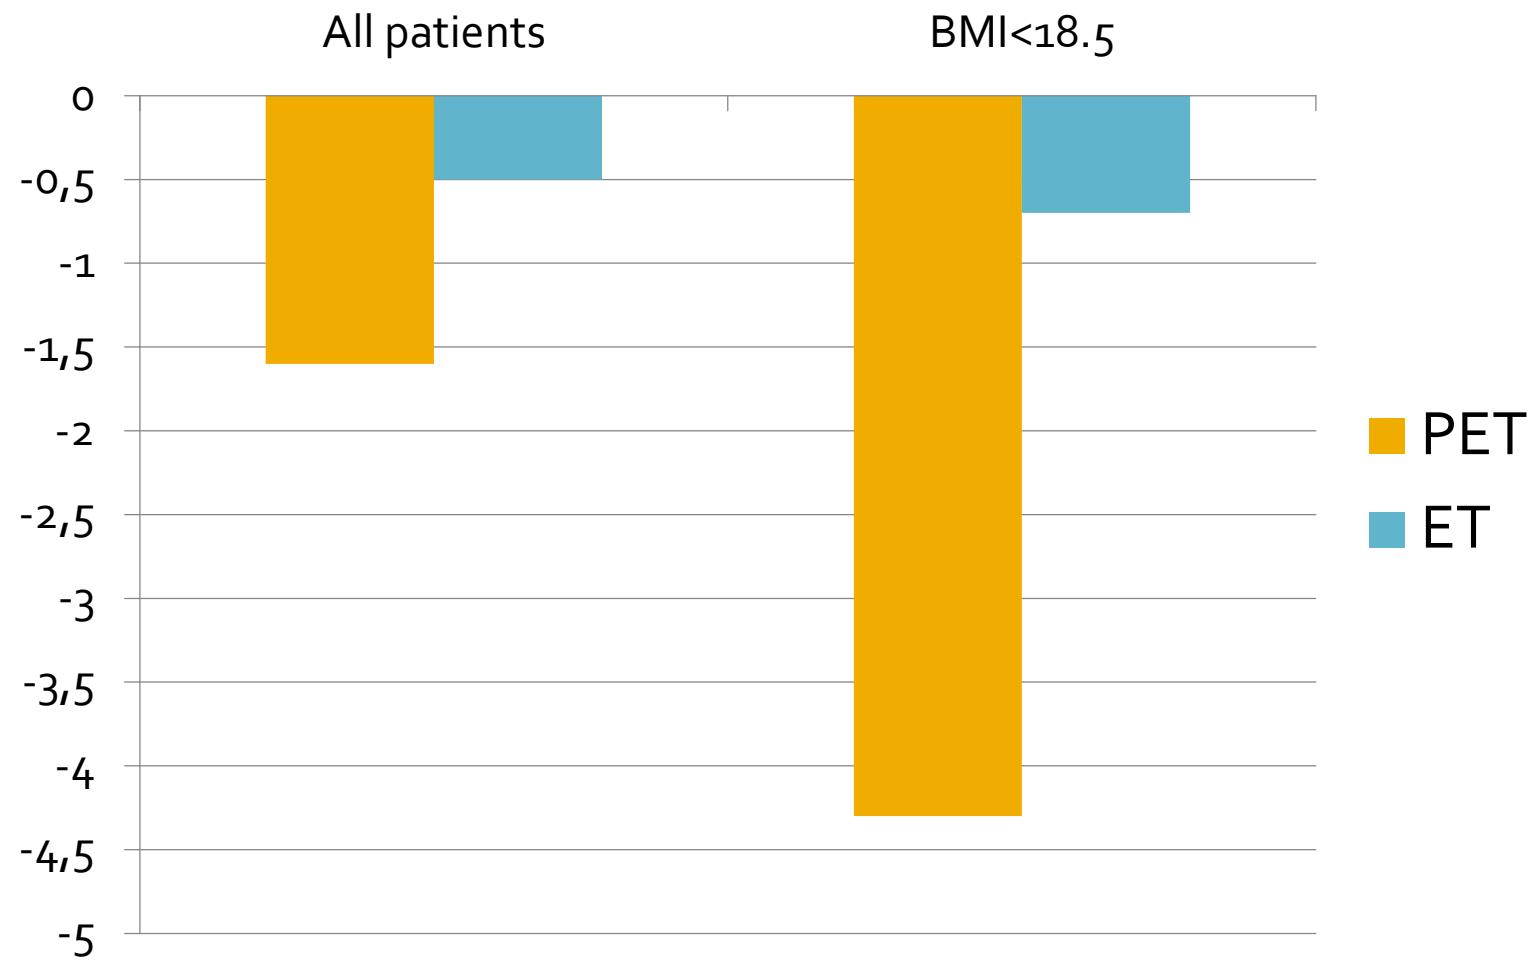

Results: Intake

	NT	PET	ET
Protein, g/kg	0.62 ± 0.30	1.56 ± 0.34	1.00 ± 0.12
Protein, %kcal	$14.1 + 5.2$	$16.7 + 1.9^*$	$14.4 + 1.9$
Energy, kcal/d	1128 ± 527	2190 ± 465	1873 ± 291
